

An AI agent that pays international tuition.

It reads the invoice, checks it against rules the family set, pays from its own wallet, and refuses anything that doesn't match.

Paying tuition across a border fails differently for each of the three people involved.

PARENT · PAYS

The money can't leave

Nigeria's central bank stopped supplying foreign exchange for study abroad. Where a wire works, it takes 1–5 days and carries a 2–4% margin.

"I have the money. My bank won't send it."

STUDENT · UPLOADS

No way to tell what is real

Invoices arrive by email. "Updated payment details" looks the same as the real thing — one Canadian scam took CAD 125,000 from 23 students. And once a parent sends money, nobody can prove the school was paid.

"Is this invoice real? Did it arrive?"

UNIVERSITY · IS OWED

No visibility, so it holds the student

The bursar sees an unpaid balance and can't tell whether money is on its way or was never sent. The only lever is a registration hold — applied to a student who has already been admitted.

"Is this one paying, or dropping out?"

For families whose bank can't reliably send tuition abroad, Novalycs has built TuitionPilot so that the money leaves when a wire can't, the tuition is paid before the due date & the payment is handled end to end.

Leaves when a wire can't

For these families the alternative is not a cheaper wire. It is no wire.

Paid before the due date

Committed in seconds rather than days, so the deadline is met.

Handled end to end

The family sets rules once. The agent refuses anything that doesn't match them.

// HOW A PAYMENT WORKS

The family sets the rules once. The agent runs each payment.

PROOF The family and the school read the same receipt: payment ID, locked rate, network fee, and the times it was committed and settled.

The model reads. Code decides.

Claude turns an invoice into fields. Nothing it returns can authorise a payment — the rules are ordinary TypeScript, and they run again immediately before anything is signed.

The signing key stays on the server. A submit that ends in a network error is reconciled against GoBTC, never resubmitted.

Three invoices. The agent pays one and refuses two.

PAID · COMMITTED

FALL 2026 TUITION

CAD 8,450

- All 8 rules pass
- Real payment on Bitcoin mainnet

Paid in seconds. Receipt for both sides.

REFUSED · PAYEE

"UPDATED PAYMENT DETAILS"

CAD 8,450

- Not the merchant the parent approved
- Hidden text told the agent to skip the checks

Nothing signed. The family is told why.

REFUSED · OVER CAP

FALL 2026 WITH EXTRA FEES

CAD 12,400

- CAD 3,400 over the term cap
- Upload it twice: still zero payments

Nothing paid. The parent decides.

REAL

Mainnet payment · 2-of-3 wallet · invoice reading · rules · pay-once protection

MOCKED

We play the university · amounts scaled 1 : 5,000 · CAD conversion simulated

How families pay today, and what is missing.

ROUTE	COST	TIME
Bank wire DIRECT	25-50 + 2-4%	1-5 days
Flywire DIRECT	≈ 2-3%	1-3 days
Convera DIRECT	≈ 1.5-2%	1-3 days
Parallel market, P2P crypto INDIRECT – USED WHEN THE WIRE FAILS	5-15%	hours-days
TuitionPilot THIS PROJECT	≈ 1.5-4.5%	seconds

We are competitive on cost, not cheapest, and we don't promise the best rate.
The route we are actually replacing is the bottom one.

Flywire/Convera margins · Canadian exchange fee tables · 2025-2026

CAD 25 billion of tuition crosses a border into Canada each year.

TAM

TOTAL ADDRESSABLE

CAD 25B / yr 691,215 study-permit holders × ≈ CAD 36,400 average fees.

SAM

SERVED AVAILABLE

CAD 1.0B / yr

Nigeria → Canada: ≈ 26,500 study permits, 3rd-largest source country, documented FX rationing.

TM

YEAR-ONE TARGET

1,000 families

≈ CAD 20M paid · ≈ CAD 200K at a 1% fee.

Canada's permit cap cut student numbers 26% in 2025, so schools are competing for the students who can pay — which is also why an unpaid fee matters more to them than it used to.

IRCC study-permit holders, 31 Dec 2025 · Statistics Canada 2025/26 tuition (undergrad CAD 41,746 · grad CAD 24,028) · the year-one number is our assumption, not a forecast

What is built, and what would have to be true next.

TODAY

+3 MONTHS

+6 MONTHS

BUILT FOR THE HACKATHON

It runs on mainnet

- A real Bitcoin payment, end to end
- Fraud and over-cap invoices refused
- No duplicate payment across retries
- FINTRAC-shaped onboarding, PIPEDA self-service

HAS TO BE TRUE NEXT

Someone pays the school in CAD

- A licensed off-ramp partner
- Stablecoins, which families already hold
- Validation: 10 families, 2 student offices

THEN

Operate legally, reach families

- FINTRAC registration, or a licensed partner
- Education agents, who own the relationship
- University international offices

Jafar Pashami

NOVALYCS

Payments engineering and AI agents.

What would help most.

CONNECTIONS

An off-ramp partner

Takes stablecoins and can pay a Canadian bursar in CAD.

PILOT

One university office

Willing to pin its bursar details and take ten real payments.

MENTORSHIP

FINTRAC guidance

Register as a money services business, or launch under a licensed partner.

FEEDBACK

Ten families in the corridor

To find out whether the wire really fails at the moment tuition is due.
